

# MOM for week 9

The client meet started with our presentation of the algorithm for the filtering process.

The client has given a new change in the database, which he forgot to give it before and asked us to implement in that way.

Some attributes made no use in the table but was asked to put in the table.

Progress table, and profiles table is one of the deadline that we must implement. Profile table is going to contain :

- ID, User ID
- Current course, module, subskill and skill topic

Client gave a complete description of filtering process for exercises into the exam template.

## **Filtering:**

Exam template parent type → Section → Type of questions → level of question → time of the question combinations.

We had a meet with the client coding team to suggest the best practices to be followed and the team contacted one of our teammate.

Use of express and routes was suggested.
