MOM for week 10(The week of R1 presentation)

Progress of the week has been discussed.

Queries:

1) Group by attribute in exam template unclear →to combine topics at what level.

2) If one question comes under two skill topics as well. How the scoring is based in initial assessment. if we group by module, and the questions is tagged with two sub skills. → We are making sure that questions are not repeated.

3) Level distribution → percentage based on time and not marks.

4) Default time and marks per question.

5) How much level of randomisation is required? This is because of algorithm for creating the assessment after all the filtering → pick the minimum number of time.

6) Constraints on number of modules, skill topics, for time complexity calculation. → algorithm should not be affected by size.

7) Max time = 30 min , min time = 0.5 min for a exercise.

8) Exercise table → how to implement the an mcq question. in what format?

9) Pass percentage → there are many percentages, for each type of questions. and combined there is one percentage for the entire assesment.

10) Using MYSQL work bench for the client to populate the database tables.

11) User profile table structure needs to be given.
